HOW TO USE THIS MANUAL

This manual contains installation details for the CD34. When used in conjunction with the Programming Manual and the User Manual, it provides the installation engineer with basic installation and programming information.

Programming

The '**Programming Manual**' for the CD34 covers all necessary aspects of programming the system. Everybody involved in installing or maintaining this panel should have access to a copy of this manual. The '**Programming Manual**' is available from your ARITECH national office.

The '**Programming Map**' for the various systems can be found at the end of this manual.

INSTALLATION GUIDELINES

The CD3412 control panel has been designed, assembled and tested to meet current standards of stability and resistance to electrical interference from the environment.

If the following guidelines are followed, the system should give many years of reliable service.

1. Ensure that there is a good earth for the alarm system.

A GOOD EARTH IS ESSENTIAL FOR EFFECTIVE RESISTANCE TO ELECTRICAL INTERFERENCE
--

Do not forget to provide a (network) earth for the telephone dialler.

2. Maintain a good separation between low voltage and mains supply cables, and use separate points of entry into the control panel cabinet.
3. Avoid loops of wire inside the control panel and route cables so they do not lay on top or underneath the printed circuit board. The use of cable ties is recommended and improves neatness in the box.
4. Mains switching relays must NOT be fitted inside the control panel cabinet. The switching of these relays may cause electrical interference.
 - 4.1 Use a relay with good insulation between the contacts and the coil.
 - 4.2 Place a suppression diode (e.g. a 1N4001) across the relay coil.
 - 4.3 Relays connected to open collector outputs of the alarm system should be rated at 12 volts DC with a coil impedance greater than 400 Ohms.
5. The remote bus cable is used for communication between the control panel and the keypads/expanders. The greatest care should therefore be taken when installing this cable. NEVER split this cable into separate cables. Do not use cables with wires which are used for TELEPHONE connections or for switching, for example, flashing lights, sirens or relays.
6. Avoid cable ducts and cable ways which contain mains power cables. This is particularly important when such ducts contain cables supplying electric motors, fluorescent lights or 3-phase power. If this is not possible, shielded cable should be used and the cable should be earthed at the control panel end ONLY.

BEFORE SWITCHING ON THE POWER

Detectors (or key switches) can be connected in two ways:

Conventional: One zone each is required for both tamper and the alarm. Both zones should be closed with an end-loop resistor (4.7 kOhm). Program the 'zones' menu as 'Alarm'.

Figure 1. Separate alarm and tamper connection

Dual loop: The alarm and tamper are placed together in one zone. The zone has two end-loop resistors (4.7 kOhm) to differentiate between alarm and tamper. Figure 2 shows how they are connected. Program the 'zones' menu as 'Dual'.

Figure 2. Joint connection of the alarm & tamper

This connection method gives the following input values:

The zone is	Resistance	Panel zone voltages	Remote zone voltages	Reaction
on standby	3k5 - 6k2	2.1 - 2.8 V	4.7 - 6.8 V	none
triggered	6k6 - 11k7	2.9 - 3.6 V	6.9 - 8.6 V	alarm
open	> 12k7	> 3.7 V	> 8.7 V	tamper
short-circuited	< 2k9	< 1.9 V	< 4.6 V	tamper

Table 1. Operation of the inputs

1. Set the DIP switches of all the remote keypads and expanders.
 2. Close the tamper switches on the remote keypads, expanders and the control panel. Also close all zones which can cause a direct alarm. If this is not done, the system will be triggered as soon as it is switched on.
- 3. Remove link JP1 from the PCB so that it returns to default settings.**
4. Supply only mains power to the control panel. The system will power up in the ARMED state. Any zones that may be open will initiate a full alarm condition and the sounders will activate.

Do not use a battery to power the system when installing or changing the installation. If there is a short circuit in the 12 volt power supply, the voltage regulators in the supply (together with the fuses) will prevent serious damage to the system. The 12 volt power supply will decrease sharply in the event of a short circuit.

If a short circuit should occur, remove the 12 volt connections one by one. When the connection with the short circuit is removed the power supply will return to 12 volts.

NOTE: ONLY KEYPAD ONE IS OPERATIONAL.

Every time power is removed from the system the control panel memorises its status. If power is restored to the panel, the system starts up again in this status (except if JP1 has been removed).

5. Enter '0' followed by the default user code '1122' at keypad 1. 'Disarm?' is shown on the display. System then disarms after pressing the '✓' button.

If the sirens have been activated, these will now stop. The status of the system or the time and date will now appear in the display.

6. Enter '0' followed by the default engineer's code '1278' at keypad 1 and press '↓' to return to programming mode.

N.B. Do not forget to initialise additional keypads and expanders with the menu 5.2, 'INSTALL REMOTE'

Replace JP1.

PROGRAMMING GUIDE

Always enter a '0' before entering an engineer/user code to prevent errors !

Under keys 1 to 9 there are 3 letters of the alphabet: press the keys repeatedly to enter first the number, then the lower case letters and then the upper case letters. Keys 9 and 0 have special symbols such as the comma and space. The arrows move the cursor during entry. Press '✓' to accept an entry. Cancel an entry by pressing 'X'.

To delete a character, overwrite with another character or a space.

Note: CD30xx stands for the keypads:
CD3008, CD3048, CD3009 and CD3049

Figure 3. Keys on a CD30xx

RETURNING TO DEFAULT SETTINGS

There are two methods of returning the system (not the dialler) to default settings, these are:

1. By removing the **JP1**. Subject to the 'Engineers Lock' not being programmed, this method will return the panel to default settings without the use of an engineer's code. Proceed as follows:
 - Remove both the battery and the mains power.
 - Remove jumper **JP1**.
 - Connect the mains power. Only keypad 1 is operational. The software version is displayed on the other keypads (if present). As the default setting is "armed" any open zones will trigger the system and the sounders will activate.
Enter '0' followed by the default code '**1122**' to disarm the system.
Use code '**1278**' to return to programming mode.
If the default codes are invalid, the system has 'Engineers Lock' blocking programmed.
If the current engineers' code is known use procedure 2, if not, then replacement of the PCB is the only way to gain access to programming mode.
2. By programming. Use this method if 'Engineers Lock' blocking is active and the engineers' code is known. Proceed as follows:
 - KEYPAD ONE MUST BE USED FOR THIS PROCEDURE
THE SYSTEM MUST BE DISARMED
 - Go to keypad 1.
 - Enter the installation engineers' code.
 - Press '6', '6' and '1' successively. You are now in the menu '**Miscellaneous**', '**Factory Prog. Menu**', '**Default Settings**'. '**Are you sure?**' flashes in the display.
 - Press accept ('✓'). '**Wait ...**' appears in the display.
 - The system has now reverted to default settings.

LEAVING PROGRAMMING MODE

Before leaving programming mode use the 'Show Open Zones' facility under the '**Maintenance**' menu (menu 1.3). If any zones shown are 24Hr zones (e.g. tamper or fire) the alarm will activate on leaving the engineers' programming mode.

If dual loop is programmed, the letter T will appear next to the zone number to indicate the tamper section of the loop is open.

Procedure:

- a. Check for open 24Hr zones (see above).
- b. Press '**X**' until '**Goodbye**' is displayed.
- c. Press accept '✓'.

DIALLER

The use of the RD6212 dialler is recommended. This dialler fits inside the control panel cabinet and is connected to the control panel's PCB using the cable supplied. The dialler may be programmed via the keypad.

A separate manual is available for the dialler.

OTHER MANUALS

Programming Manual CD3412	<i>A fully documented programming information manual.</i>
User manual	<i>Details user options.</i>
Manager Manual	<i>A user manual which examines the options in more depth. Intended for the manager.</i>
Programming Manual RD6203	<i>Documented information on programming the RD6203 dialler.</i>

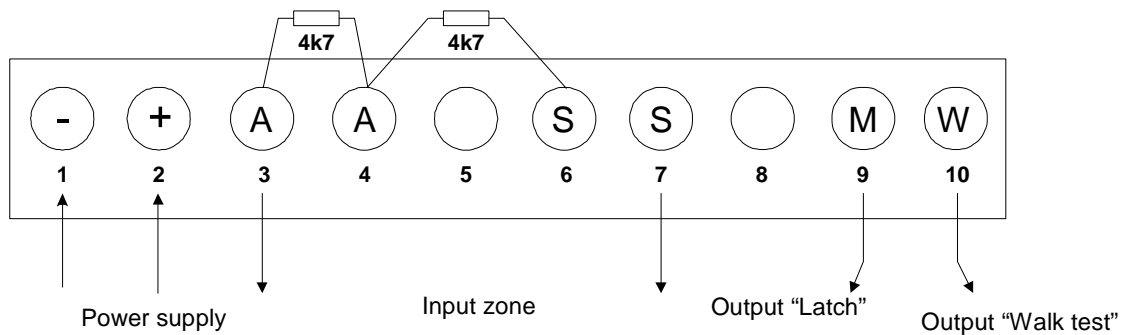

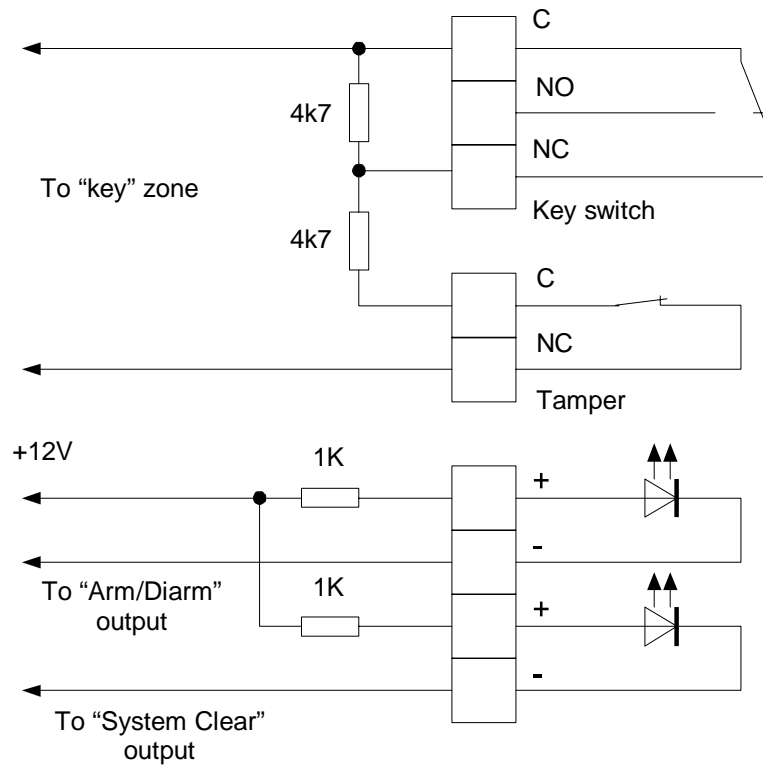

Figure 10. Dual loop connection of a detector with latch

Note: Before connecting, the cable between terminal 2 and terminal 10 should be removed!

CONNECTING A KEY SWITCH

Programme outputs for negative applied (-)

Figure 11. Connection of a key switch with LED's

CONNECTING A RELAY OR AN LED

Figure 12. Connection of a relay or an LED on the output

The resistor R is necessary to adjust the current. For most LED's a current of approximately 15 mA is sufficient. The resistance calculation is as follows:

$$R = \frac{V}{I} = \frac{13.8V - V_{led}}{15 \text{ mA}} = \frac{13.8V - 2V}{15\text{mA}} = 787\Omega$$

When rounded off this is 820 Ohms.

ZONES

Zone Types		Zone Options
No.	Standard	Standard
1	Exit/Entry 1	InCh
2 to 10	Alarm	In

Table 4. Input default settings

Zones 7 to 10 are only available when the panel is expanded using the plug-in CD3004 expander or the CD3048/3049 keypads.

AS270/AS271 INTERNAL SIREN

Note: *) This fixing screw is used for pry-off tamper.
 **) Screw to close siren.

Connection:

1. Tamper
2. Tamper
3. + 12V
4. - 0V Speaker
5. - 0V Beacon

Programming in the panel:

	Connection AS270/AS271	Programming Output		Panel connection
		Description	Output	
CD3412	1 Tamper			terminal 16
	2 Tamper			terminal 17
	3 + 12V			terminal 23
	4 - 0V	Internal siren	05 Internal siren -	terminal 24
	5 - 0V	Flash/Beacon	05 Internal siren -	terminal 24

OUTPUT

The outputs can be represented as switches that connect the output to 'Negative.'

If you program an output for activation as '-', the switch is closed on activation and the output is negative. If it is programmed as '+', on activation the switch is open and the output is +12 Vdc via the 4k7 resistor.

Alternations to output programming only takes effect after leaving programming mode.

Outputs 1 to 4 can provide **100mA**, the outputs of the internal siren (5) and external siren (6) can switch **1A**.

ATTENTION: Outputs are switched to negative. Connect **devices** between +12V and the output.

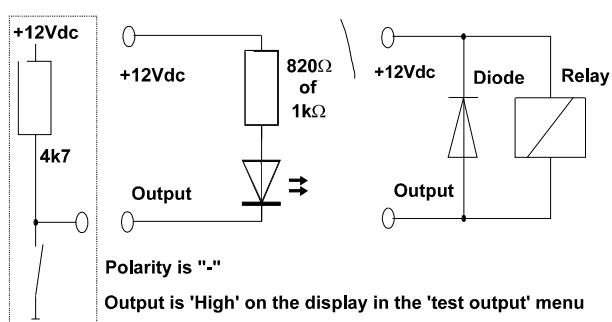

Figure 16. LED or relay connection to outputs
(dotted box shows the principle of an output)

Output		
No.	Standard	
1	PA	+
2	Fire	+
3	Alarm	+
4	Disarm/Arm	-
5	Internal siren	-
6	External siren	-

Table 5. Default output settings

Keypad buzzers are pre-programmed and cannot be accessed. Keypad output OB on CD3048/3049 keypads cannot be used.
