C4

BUILDING SECURITY
AND OPERATING INTEGRATION SYSTEM

Ten reasons when to use the C4 integrated security system

1. I manage access cards and passwords across multiple devices

2. I use various devices from various manufacturers at my company

3. I have to manage remote offices or multiple companies

4. It is necessary to delete access rights of a former employee from all security systems within 30 minutes

5. My work requires up-to-date information from security devices

6. I search for records from cameras

7. The time in devices is synchronized to help with searching for a record

8. More people work with security information

9. I need to access information from a business trip or from home

10. It is necessary to check the performance of the service company

Office Buildings

Customize your office space just as your tenants like it

Increased competition in the field of office space rentals has placed greater emphasis on the quality of the building itself, as well as the quality of the additional services offered. Nowadays, tenants consider complex building security to be standard. Landlords have to struggle with ever-changing clientele or the structure of leased office space. This creates additional costs for implementing changes in building security provisions and increases the risk of selecting a less efficient security solution.

Based on the changing requirements, the C4 system provides an easy way to quickly and easily change the security settings

of an office building. It also provides individual office users with detailed information about the setup of the security system that is protecting their premises. The system is also able to automatically notify all necessary parties regarding information about security events.

The C4 system is equipped with a visitor module that can keep track of visitors in the building. Visitor management can be performed globally, or customised to address the specific needs of every tenant's reception desk.

The C4 system ensures:

- Immediate overview of security systems statuses
- Dynamic changes to security settings
- Premises management for every tenant
- Ability to implement previously applied technologies
- Significant reduction of operating costs

Security Agencies

Obtain detailed information about monitored area

These days, property protection is usually performed by central protection desks. The C4 integrated security system improves the quality of services in the field of central security monitoring by providing detailed information about individual parts of the security system, even at the individual indicator level. By integrating all security technologies into one centralized solution, the dispatch office is able to access complex information from all areas, which significantly reduces the cost of false alarms and improves the work of security units. Emergency guidelines provide the security unit with information that enables the operating personnel to significantly increase intervention quality.

The C4 system can share information between the security agency and the owner of the building. The owner of the building is able to get up-to-date information about the status of security devices and the overall situation in the building, as well as information about the status of various events and about the progress of the security agency. This creates a completely new kind of relationship between the customer (owner) and security agency.

The C4 system ensures:

- Detailed evaluation of security events
- Reduced amount of interventions caused by false alarms
- Security process optimization
- Integration of previously owned devices
- Reduction of operating costs

C4

Transport

Optimize servicing costs

Transport systems nowadays implement various technology that is stationed in remote buildings, usually without service. As a result, any technical issue or security event requires sending a qualified technician to tackle the problem on-site.

The C4 integrated system can collect information from all monitored devices. Data is immediately available to the operating personnel, regardless of where they are situated, as well as to the service company, which can assess the problem and act accordingly. This solution significantly reduces operating costs and the service cost of remote technologies.

If an immediate service operation is necessary, the C4 system can resolve non-standard situations efficiently (either through remote authorization of servicing personnel or remote access authorization from the central dispatch office). The operating personnel gains tools for routine operations support (such as security and fire alarm systems checkups), as well as guidelines for tackling security events or technical failures. Thanks to time synchronization in monitored devices, the C4 system provides operating personnel with a complex overview of all events from all devices at the same time.

The C4 system ensures:

- Central dispatch office for all monitored devices
- Simplification of emergency situation solutions
- Clearer monitored device status
- Service control information
- Security process optimization
- Integration of previously owned devices
- Reduction of operating costs

Chain Stores

Simplify complaints and product security

The popularity of shopping centers and chain stores is increasing. Their basic feature, from a security point of view, is the large concentration of products in one place. The C4 integration security system provides the ability to monitor the security of stored products, together with cost optimization for processes dealing with customer complaints.

Interconnecting the security devices in a store with the cash desk system makes it possible to pair information from receipts with information from a camera system. Your controlling personnel can then monitor what is happening with the products at the

cash registers via a single display in real time. The C4 system can provide notifications when selected types of products are being billed. Additionally, the C4 system provides a reliable verification, in case of complaints about an incorrectly billed product. Based on the receipt, the system can display a recording from a corresponding camera that has been paired with the billing.

Companies often use receipts as part of their marketing campaigns. That is why the C4 system is designed to quickly adjust to changes in shape or content of the receipt, while minimizing additional costs.

The C4 system ensures:

- A simplified customer complaint process
- Compatibility with dynamic changes to receipts
- Increased efficiency of theft documentation
- Implementation of existing devices and cash register systems
- Reduction of operating costs

Corporations

Gain absolute control over security systems in your branch offices

Larger companies usually own a network of office buildings that can cover large areas. This makes security systems management significantly more difficult. The traditional localized solutions, which are based on systems that administer each premise independently, often fail to meet customers' increasing requirements for flexible and variable security management.

The C4 system provides security system centralization, including the integration of previously owned devices. The C4 system provides access to complex, real-time information about every building, as well as data for assessing security events. The C4 system also enables centralized access permissions management for all monitored devices.

By simplifying the security structure in every premise and the statuses of every monitored device, as well as through management centralization, the C4 system optimises the security processes and lowers the costs of maintaining building security and security threat assessment.

The C4 system enables a multi-language management option, device management that operates in multiple time zones and supports a national holidays of multiple countries. It has no restrictions regarding the number of users or workplaces.

The C4 system ensures:

- Centralization of security systems throughout the company
- The ability for responsible authorities to locally manage the building
- Simultaneous support for national holidays in multiple countries
- Management of devices operating in different time zones
- Clearer monitored device status
- Improved security event assessment
- Security process optimization
- Integration of previously owned devices
- Reduced operating costs

Industrial Parks

Use interconnected security systems for emergency situation assessment

Industrial centers can be characterized by a large amount of miscellaneous buildings in a single area. These buildings often have varying levels of security or fire risk. Another factor is the high turnover of both internal and external employees, which leads to a constant need to change access rights.

By interconnecting supervision, fire alarm and other systems with a centralized monitoring station, the C4 system provides a system for efficient information gathering. In case of a security event, time synchronization of all security technologies provides the ability to immediately generate a complex report on security events with data from all monitored devices. This is contributing to the fast and competent decision-making. Operators can use optimal solutions to solve emergency situations that are provided by the integrated emergency guidelines module.

The C4 visitor module enables recordkeeping of training provided to visitors to hazardous areas, if the premises agenda requires such training. It also provides information about everyone within the hazardous areas, including visitors.

The C4 system ensures:

- Interconnection of all technologies into a centralized system
- Dynamic creation of dispatch offices according to current needs
- Fast emergency situation assessment and proper response suggestion
- The ability to connect previously owned devices
- Significant reduction of operating costs
