

Product Data Sheet

DF963

Gate Bypass Module, Locally Activated by Keyswitch

The Gate bypass module is used to bypass a protected gate without triggering an intrusion alarm. The module operates in secure and access modes. When the unit is in secure mode, the gate is monitored by the system. It acts as any other section of protected fence and an alarm triggers whenever an intrusion attempt occurs. When placed in access mode by using the local keyswitch the gate is unprotected, hence no alarm is triggered when the gate is used.

Standard Features

- Allows to use a gate without triggering an alarm
- Locally activated
- Secure and access modes
