

Product Data Sheet

DF964

Gate Bypass Module, remotely activated by computer control

The Remote Gate bypass module is used to bypass a protected gate without triggering an intrusion alarm. The module operates in secure and access modes. When the unit is in secure mode, the gate is monitored by the system. It acts as any other section of protected fence and an alarm triggers whenever an intrusion attempt occurs. When placed in access mode using the remote controlled relay the gate is unprotected, hence no alarm is triggered when the gate is used.

Standard Features

- Authorised use of gate does not trigger alarms
- Remotely activated
- Secure and access modes
